

# Slash distribution

Slash

|                     |   |
|---------------------|---|
| <b>ex.kurtosis:</b> | Does not exist                                      |
| <b>entropy:</b>     |   |
| <b>mgf:</b>         | Does not exist                                      |
| <b>cf:</b>          | $\sqrt{2\pi}(\varphi(t) + t\Phi(t) - \max\{t, 0\})$ |

In probability theory, the **slash distribution** is the probability distribution of a standard normal variate divided by an independent standard uniform variate<sup>[1]</sup>. In other words, if the random variable  $Z$  has a normal distribution with zero mean and unit variance, the random variable  $U$  has a uniform distribution on  $[0,1]$  and  $Z$  and  $U$  are statistically independent, then the random variable  $X = Z / U$  has a slash distribution. The slash distribution is an example of a ratio distribution. The distribution was named by William H. Rogers and John Tukey in a paper published in 1972.<sup>[2]</sup>

The probability density function is

$$f(x) = \frac{\varphi(0) - \varphi(x)}{x^2}.$$

where  $\varphi(x)$  is the probability density function of the standard normal distribution.<sup>[3]</sup> This is undefined at  $x = 0$ , but the discontinuity is removable:

$$\lim_{x \rightarrow 0} f(x) = \frac{\varphi(0)}{2} = \frac{1}{2\sqrt{2\pi}}$$

The most common use of the slash distribution is in simulation studies. It is a useful distribution in this context because it has heavier tails than a normal distribution, but it is not as pathological as the Cauchy distribution.<sup>[3]</sup>
